

CUTTING AND TRIMMING BATTERS

For smaller batters:

- Approach the batter and position the grader in the crab steer position with the front wheels up on the batter and the rear wheels on the ground.
- Angle the blade up so that you are cutting the materials on the correct angle to form the batter properly.
- Keep the engine at a constant speed and make sure you are traveling straight.
- The materials should form a small ridge at the edge of the batter after the grader has completed its run.

CUTTING AND TRIMMING BATTERS

For larger batters:

- The grader may need to be positioned with the front wheels on the angled surface.
- Make sure the wheels are tilted back away from the batter.
- Position the blade so that it is tilted back towards the downward angle.
- Maintain a safe speed at all times and monitor the stability of the grader.
- Move safely down from the batter as you approach the end of the run and reposition the blade to allow safe movement and repositioning of the grader.
